

## REPAIR FORM

Before you spend your hard-earned money on sending your pedal to us for repair, please troubleshoot the following things:

- Check your power supply** – 9V DC output, center negative ONLY. Try a different 9V DC output, center negative power supply to ensure you don't have a bad supply/barrel. One power jack does not fit all...some are loose, some are tight.
- Check that the input is plugged in on the right and output is on the left**
- Test the pedal alone (instrument -> pedal -> amp)** – no other pedals in the signal or power line, not even turned off.
- Check the manual** – it might just be user error. Manuals are found on each pedal's page here: <http://fuzzrociouspedals.com/shop/>.
- Did anyone besides you use the pedal?** – is there any chance that a friend damaged it or mispowered it?

If the pedal still doesn't work, let's get it repaired and back on your pedalboard! Please include this form in your well-packed shipment box. To ensure your pedal arrives to us in the same condition you currently have it in or at all, we suggest using bubble wrap and insuring your shipment for loss/damage. Using newspaper, printer paper, air bubbles, or shipping in an empty box can result in further damage and more repair fees.

Please visit <http://fuzzrociouspedals.com/termsandconditions/> to read about what is and is not covered by warranty as well as repair rates and shipping responsibilities, if applicable.
